

*Psychophysiological Effects of Frequency Octave Related Light and Sound*

By Richard A. Jelusich

1999

Abstract

There is a frequency relationship between visible light and audible sound, as perceived by man. The research project will begin with a discussion of light and sound and relevant studies being performed as to their properties in affecting human physiology and behavior. Significant healing work in the field has been performed, illustrating the innate relationship to of light and sound as frequencies along the electromagnetic spectrum, and their effects when applied to therapy.
