

*A Conceptual Study into the Creation of a Prototype Intelligent System for Enhancing the Utility of the Apparatus for Measuring the Functioning of the Meridians and their Corresponding Internal Organs (AMI)*

By Thomas Gregory Stanaland

1998

Abstract

The results of this investigation cumulated in the creation of a working prototype model of an intelligent system that answers specific questions from selected AMI diagnostics. The relevance of this system is in its ability to demonstrate empirically that applied artificial intelligence theory can be a viable alternative or adjunct method for enhancing the utility of the AMI.
